Financial Company

Project Manager / Web Application Developer

Oversee multiple projects for a nationwide network of established merchants; independent retail locations authorized payment centers. Managed migration of online tool from ASP to ASP.Net using the .Net Framework, with VB.Net and SQL Server for the database. Designed User and Technical specifications tailored to the needs of our Client and also our technical team. Designed and implemented test plan and created test scripts while training our QA department on the new features of the Multi User Web application. Created Stored procedures and Custom reports using SQL Server Reporting Services Tool. Allocated development resources for each module of the Multi User Web Application Project, Customization Project and Report Portal Project. Participated in development of each project using Ado.net, SQL Server, Vb.net and ASP.Net. Successfully completed each project while functioning as project manager and web application developer. Project Overview: Multi User Web Application: The previous site allowed one Agent to login to the system at each location. An agent could have multiple employees however they had to use the same id to login to take Transactions. Moved the Online Site from Single User to Multi User allowing each agent to have multiple logins for employees associated with their agent number. This gave the agent and the Company the opportunity to keep track of transactions, sales and also eliminate or minimize fraud. The project was written using the .Net Framework, with VB.Net and using SQL Server for the database. The Agent now has two levels of authentication. The first is Windows Authentication and the second is a database driven authentication user Id and password response. The Admin of each Agent now has the ability to customize their users and determine the rights available for each user. Since there are agents throughout the country the project also now allows the user to save transactions in local time versus server time. The project also provided Reports for the Agents using the Reporting Services tool provided by SQL Server. Customization Project: This project allows customization of the Multi User Web Application based on the Agents login. Since several of the agents are chains or major corporations we have given them the ability to customize their site based on their Windows Authentication Login. Report Portal: The Report Portal is an extranet that uses Internet Technology allowing Suppliers, Vendors and Partners to login to the Portal and view Custom Reports. The User is allowed to drill down on specific reports based on their login information, print reports and set up alerts. This project was designed and implemented to give our Suppliers, Vendors and Partners access to specific information that may concern their organization. This allows them to view reports and make key business decisions based on specific data.

Retail Web E-Commerce Site

Contract - .Net Application / Web Developer

Dynamic, motivated individual who has solid development skills, is current with the latest Microsoft development technologies. Participated in the full lifecycle application development of world-class E-commerce systems. Played a key role in the design, development and deployment of an international E-commerce application.
